Vulnerability Assessment Report

Target: http://demo.testfire.net

Name: Nagender Thokala

Date: 01 April 2026

1. Target Information

Target URL: http://demo.testfire.net
Application Type: Web Application
Scope: Vulnerability Assessment using OWASP ZAP

2. Tools Used

- **OWASP ZAP**
- **Nmap**

3. Findings

Vulnerability	Risk	Description	Fix
Cross-Site Scripting (XSS)	High	Input not sanitized	Validate input
SQL Injection	High	DB queries vulnerable	Use prepared statements
CSRF Missing	Medium	No CSRF protection	Add tokens
Missing Headers	Low	Security headers missing	Add headers
Cookie Without http only Flag	Low	Cookies lack http only attribute	Set http Only and Secure Flags

4. Screenshots

5. Conclusion

The vulnerability assessment was carried out successfully using OWASP ZAP on the target web application. During the testing process, several security issues were identified, including Cross-Site Scripting (XSS), SQL Injection, and missing security headers. These vulnerabilities indicate that the application has weaknesses that could be exploited by attackers if proper precautions are not taken.

Addressing these issues is important to improve the overall security of the application. Implementing proper input validation, using secure coding practices, and configuring necessary security headers can significantly reduce the risk. By fixing these vulnerabilities, the application can become more secure and reliable for users.
